

Cleaning the Steamer:

- To clean the steamer, add two tablespoons of white vinegar and fill to the top (to fill line) with water.
- Turn on steamer and heat to steaming. Do not turn on ozone switch.
- Let machine steam for 30 seconds.
- Turn off steamer and let solution sit for 15 minutes. Because vinegar has a pungent smell, clean in a room away from treatment rooms to avoid fumes traveling to other areas of the spa.
- Drain steamer completely and then refill with water. Let steamer heat to steaming and operate for approximately 10 minutes. If there is still an odor, drain the unit and repeat the process.
- Do not let this solution set in the steamer overnight for it will corrode the copper coils.
- Do not overfill the steamer above the maximum level indicator. This can cause it to project a spout of boiling water at the onset of the steaming.

Infection Control:

- Refer to OSHA and your state board.
